

September 30, 2026

Many of our customers like to inquire about what types of base oils, additive chemistries, or other technologies are used in the formulation of AMSOIL products.

Although specific formulation information is considered proprietary, we can assure our customer that the AMSOIL formulations are engineered without compromise. As an independent lubricant manufacturer, we are free to source the most advanced base stocks, including premium PAOs, synthetic esters, plus other high-performance synthetic chemistries available globally. In addition, AMSOIL uses state-of-the-art additive technology to deliver exceptional wear protection, thermal stability, cleanliness, and long-term durability. We do not formulate lubricants to the minimum required standard. Instead, we formulate lubricants to maximize equipment protection and performance.

AMSOIL is continually testing and evaluating the performance of our lubricants. Some of this information is shared on our website: <https://www.amsoil.com/performance-tests/>

We hope this information is helpful.
